SCI-AGRO Presentation

Your product.
Our responsibility.

Who we are

KNOWLEDGE APPLIED TO THE SAFE DEVELOPMENT OF AGRICULTURE

The sponsor is our priority

Close partnership, responsive technical contact and compliance with agreed deadlines.

GLP recognised since March 2019

A team of 130+ specialists

High scientific quality

Applied research based on test guidelines, including specific demands uncommon in registration packages.

Facilities

TEST FACILITY LOCATED IN CHARQUEADA / SP, BRAZIL

11,000 m²

of area supporting studies and laboratory routines.

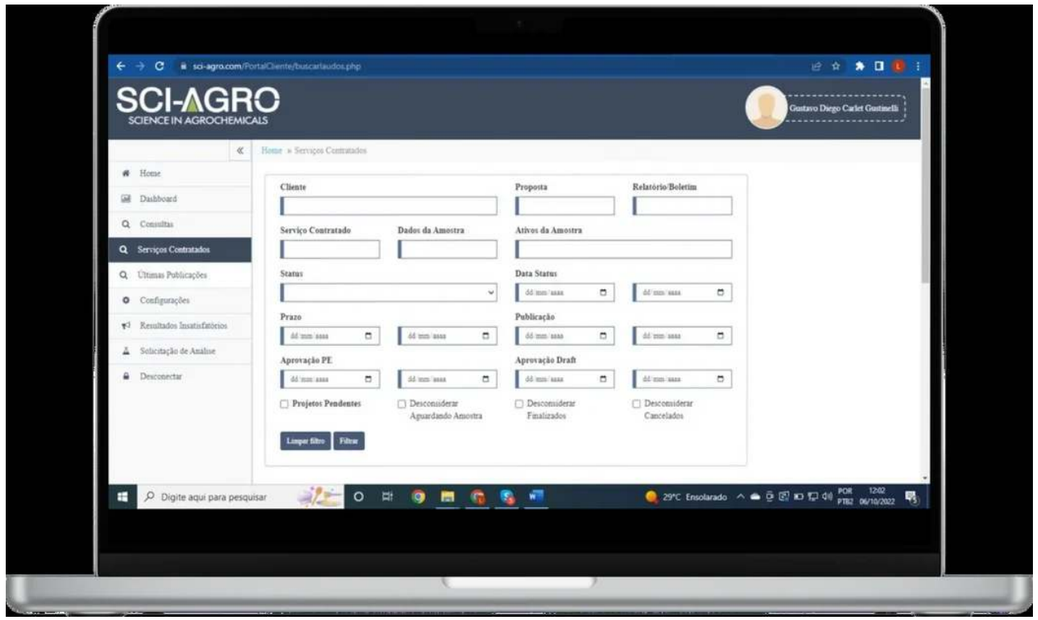

Continuous expansion

Ongoing investment in facilities and technology.

A structure designed to combine operational capacity, technical reliability and a fast response to market demands.

Quality and monitoring

TRANSPARENCY IN PROJECT MANAGEMENT

PMO

Responsible for monitoring project progress.

Client portal

Project status and report access through the website.

Technical team

Experienced professionals and quick contact.

Languages

Simultaneous issuance when required.

Structured monitoring to reduce noise, gain predictability and keep the sponsor close to the operation.

Our services

TECHNICAL SCOPE FOR DIFFERENT REGULATORY DEMANDS

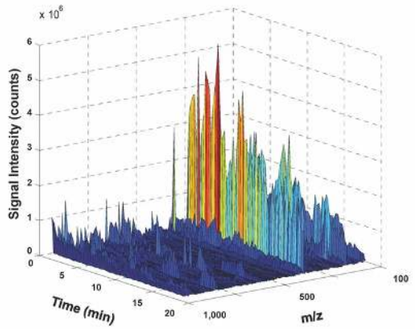

- 5-batch Analysis
- Genotoxicity Studies
- Physicochemical Studies
- Ecotoxicology Studies
- In vivo & in vitro Toxicology Studies
- Microbiology
- In silico Toxicology
- Pesticide Residues
- R&D and training

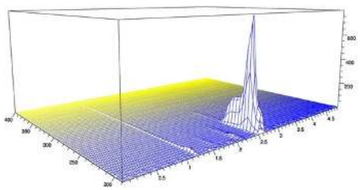

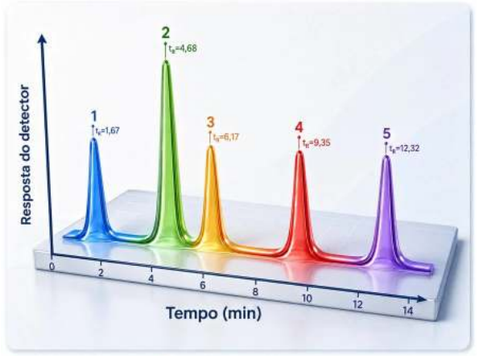

5-batch Analysis

ROBUSTNESS FOR TECHNICAL AND PHYTOCHEMICAL PRODUCTS

- Compliance with multiple regulatory authorities: **SENAVE, SENASA, COFEPRIS, EU, EPA**, among others.
- Experienced team in conducting studies and in the technical interpretation of data.
- Isolation and certification of impurity standards with unequivocal identification.

An advantage for phytochemical products.

Physicochemical Studies

MORE THAN 63 STUDIES IN SCOPE

- Extensive scope covering requirements in **Brazil, Europe** and **South American** countries.
- Includes explosivity, Henry's law constant, chemical incompatibility and auto-ignition.
- Critical assessment of test guidelines for each formulation type.
- Investment in modern equipment for speed and precision.

Precise technical application of the guidelines: one less layer of uncertainty in the regulatory package.

Physicochemical Laboratory

MODERN ANALYTICAL INFRASTRUCTURE

Equipment, team and method working as a single technical mechanism.

An environment prepared for studies that require precision, traceability and control at every stage.

Ecotoxicology Studies

AQUATIC AND TERRESTRIAL

- Rigorous conditioning of species according to each test guideline.
- Specific care in the experimental handling of each species, including bees and climate conditions.
- Analysis of working solutions by sensitive techniques such as **LC/MS-MS**.
- Non-GLP testing during the formulation development stage.

Detailed experimental control for technically sound biological responses.

Ecotoxicology Laboratory

EXPERIMENTAL WORK WITH SENSITIVE SPECIES

Facilities, protocols and operational care for reliable ecotoxicology studies.

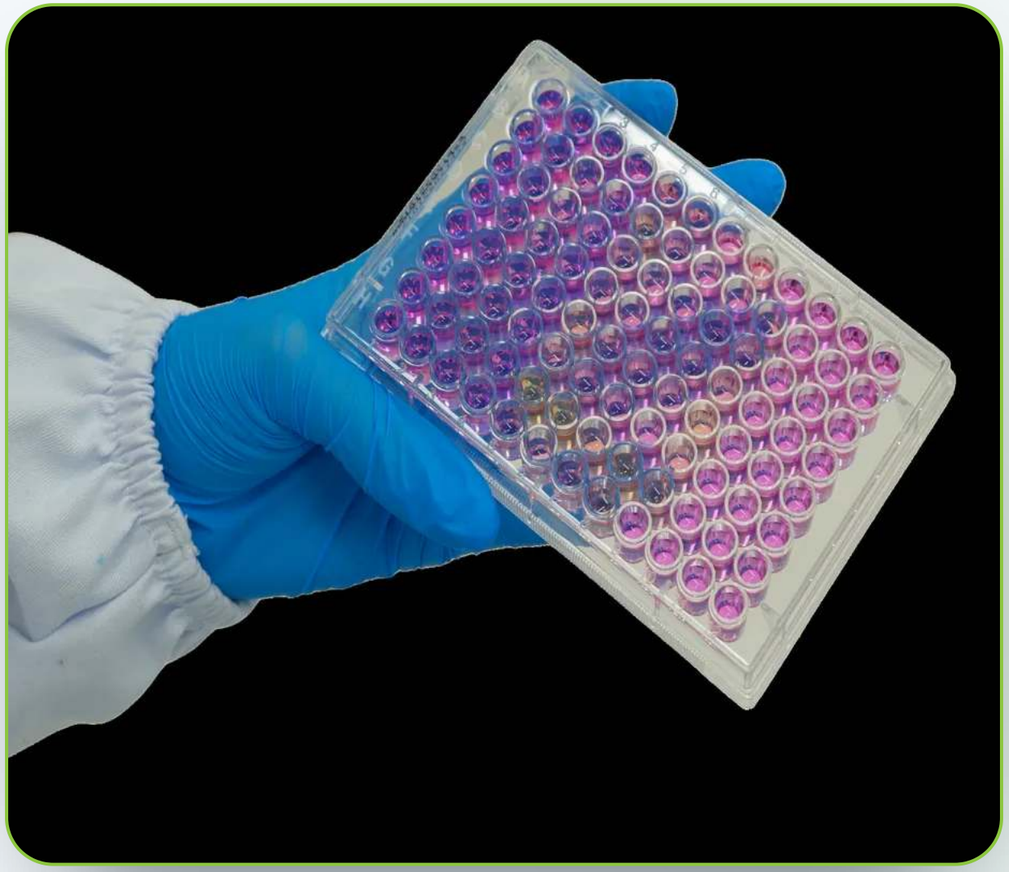

Proper preparation and conditioning help protect the validity of the assay even before the first reading.

Genotoxicity Studies

MEETING REQUIREMENTS AND OECD GUIDELINES

- Studies designed to meet regulatory requirements, including **OECD 490 and 476**.
- Modern, higher-precision equipment, such as flow cytometry for micronucleus studies.

OECD 471	**Bacterial Reverse Mutation (Ames)**
OECD 474	**In vivo Mammalian Erythrocyte Micronucleus**
OECD 487	**In vitro Mammalian Cell Micronucleus**
OECD 476 / 490	**In vitro Mammalian Cell Gene Mutation**

Genotoxicity Laboratory

PRECISION IN CELLULAR AND MOLECULAR STUDIES

A technical environment prepared for studies requiring repeatability, standardization and precise readings.

The combination of method, instrumentation and team reduces the margin of uncertainty in critical assessments.

In vitro Toxicology Studies

TECHNICAL EXPANSION ALIGNED WITH CONCEA

- Expanding in vitro toxicology, with new guidelines as recognised by **CONCEA**, Brazil's national animal research council.
- Includes guidelines such as **492B** and **442D**.
- IATA — Integrated Approaches to Testing and Assessment.
- Successful acceptance of **OECD 490** studies for Phase II of a technical product.

Less reliance on in vivo models and greater technical speed whenever the guideline allows.

In vitro Toxicology Laboratory

NEW GUIDELINES, NEW MODELS, GREATER EFFICIENCY

A growing area for faster studies, with technical rigour and alignment with good practices.

The expansion of in vitro work follows regulatory developments and the search for technically accepted alternatives.

Microbiology Studies

MICROBIOLOGICAL SAFETY OF THE PRODUCT

- SCI-AGRO performs microbiological analyses to assess the **presence and behaviour of microorganisms** in different matrices.
- Supports product quality and compliance with regulatory requirements.

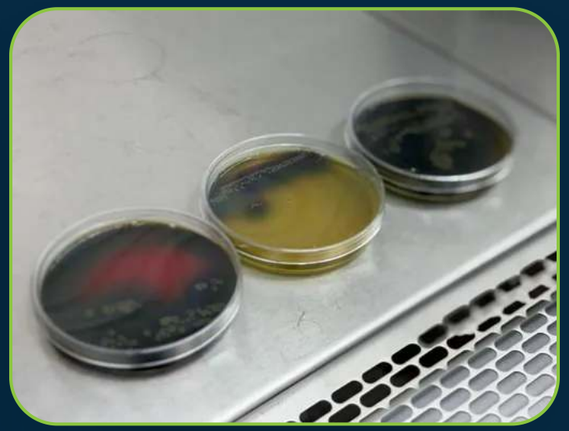

Microbiology applied to safety and compliance.

Microbiology Laboratory

CULTURE, ISOLATION AND COUNTING UNDER CONTROL

Infrastructure prepared for specific studies, including the Ames test with Salmonella to assess mutagenic potential.

Reliable microbiological data support safer decisions, regulatory compliance and responsible product development.

In vivo Toxicology Studies

RELIABILITY, CONTROL AND ETHICAL RESPONSIBILITY

- Reduction in the number of in vivo studies: ocular, dermal and micronucleus.
- Modern animal facility with an appropriate air exchange system and clean rooms.
- **SCI-AGRO CEUA** — institutional animal care and use committee: tests reviewed and approved to minimise animal suffering.
- Registered with **CONCEA**.

Environmental control and ethical responsibility are part of the reliability of the result.

In vivo Toxicology Laboratory

CONTROLLED ENVIRONMENTS FOR CRITICAL STUDIES

Rooms, animal facility and operational flow designed to reduce external variables.

The routine combines controlled infrastructure, ethical approval and documented traceability.

Pesticide Residue Studies

ANALYTICAL PHASE WITH STATE-OF-THE-ART TECHNOLOGY

- Analytical phase of residue studies.
- Professionals experienced in method development, validation and analytical conduct.
- State-of-the-art equipment: liquid (**LC/MS-MS**) and gas (**GC/MS**) chromatography.
- Able to act as **Principal Investigator** or **Study Director**.

Analytical precision to support regulatory decisions and product development.

Pesticide Residue Laboratory

INSTRUMENTATION FOR SENSITIVE ANALYSES

Infrastructure focused on sensitive detection, traceability and data robustness.

A key stage for products that need to reach the market with technical consistency.

Predictive Toxicology

IN SILICO — QSAR

- Use of at least **three software platforms**.
- Cross-referencing of predictive data with literature data for a complete, well-founded report.
- Approval by regulatory authorities with no further requirements.

Integration of software, literature and technical interpretation to reduce uncertainty.

The SCI-AGRO Commitment

APPLIED SCIENCE TO BRING NEW PRODUCTS TO MARKET

Helping new and better products reach the market, with a commitment to safeguarding health, human safety and the protection of the environment.
